

Production of indicators

New perspectives and
challenges

The current situation of the production of indicators

- The evolution of research landscape and the new demand for indicators:
 - Change in scale
 - Change in funding schemes
 - Change in needs and expectations concerning the indicators
- From statistical indicators and the production function to positioning indicators

What is at stake?

- The building of the ERA and the role of European Research Institutions through two examples (internationalisation, innovation capacity of RPO)
- What is our common interest in measuring our performances?
- The evaluation of funding schemes and research programmes in the perspective of the ERA through indicators of our own

The objectives of this workshop

- To better understand what are we speaking about when speaking of indicators
- In the two areas pre-identified:
 - To know the indicators that are currently used in MOs
 - To understand for what purpose they are designed and produced
 - To identify those that could be relevant and feasible at European scale

The objectives of this workshop

(continued)

- To understand if and how we could aggregate the existing indicators or to begin to outline designing the indicators we would like to share

The objectives of this workshop (continued)

- Agreeing on the previous steps means:
 - that we would be able to analyse the needs of the users
 - That we would be able to design relevant indicators
 - That we agree to develop common methodology and techniques to launch a pilot study among some of us and to collect data for indicators production
